

## PowerFlex 750 Series: 20-750sc-8U Setup

### Question

Is there a setup guide for the 20-750sc-8U card (8-Channel Universal Analog Input Module)?

### Environment

- 20F PowerFlex 753
- 20G PowerFlex 755
- 20G PowerFlex 755T

### Answer

The 20-750sc-8U 8-Channel Universal Analog Input Module is a card manufactured by Spectrum Controls.

It will work with either the PowerFlex 753, PowerFlex 755 or PowerFlex 755T products. The card is designed to accept either a 0-20 mA, 4-20 mA, 0-5 V, 0-10 V, a resistance measurement or an RTD input.

The user manual for the card is put out by Spectrum Controls and can be found on the link below:

[Spectrum Controls: PowerFlex 8-Channel Universal Analog Input Module](#)  
Spectrum Controls User's Manual Publication 0300287-03

The purpose of this technote is to give a quick reference to setup the card.

---

### ***Install the card***

The Spectrum card can be installed in slots 4, 5, or 6. Option cards cannot be installed or removed with the drive powered. Install the card in one of the supported slots and secure it using the thumb screws at the top and bottom of the option card with a T15 Hex screwdriver.

## ***Wiring the card***

The terminal blocks are removable and are clamp style. Wires should be shielded, twisted pair. The shield should be kept as short as possible and connected to the drive chassis. Strip the wire and push into the appropriate hole while pressing the orange tab next to the hole.

Limited wire  
exposed outside of  
shield

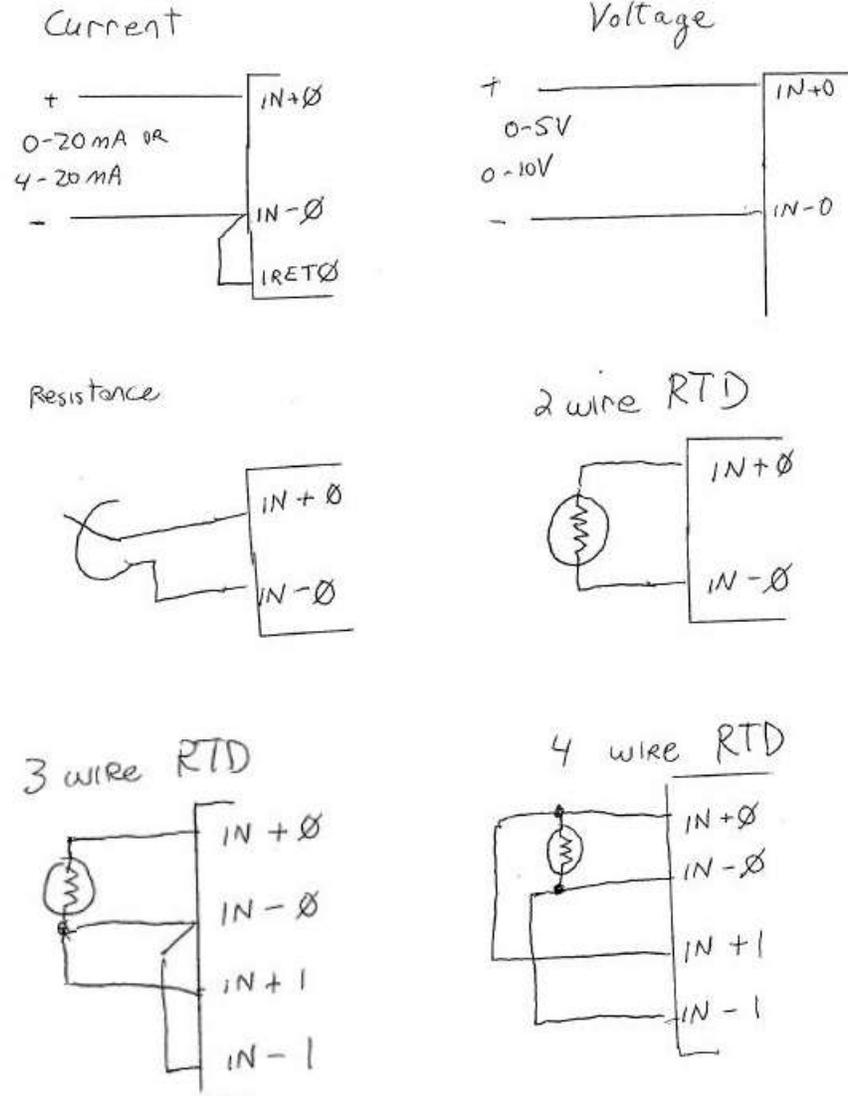

Shield  
termination wire  
kept short and  
terminated close  
to the option card

A given input on the card can be wired for any one of the following:

- Current 0-20 mA, or 4-20 mA
- Voltage 0-5 V or 0-10 V
- Resistance measurement (0 - 20, 150, 500, 1000, or 3000 ohm)
- 2 wire RTD input
- 3 wire RTD input
- 4 wire RTD input

Examples of each are given below

**Note 1:** Many of the wiring examples show multiple wires connected at a single terminal block, the clamp style terminal block can be challenging with these connections. It is highly recommended to solder these wires together before trying to land multiple wires at the same terminal.

**Note 2:** There is a slight difference between Even and Odd channels. The 0-20 ohm & 10 ohm copper inputs are not available on the Odd Channels.

### **Configure the Card**

The card has two types of parameters. They are "Host" and "Device". Host parameters reside on the main control board. Device Parameters reside on the card itself. If the card is moved from one drive to another, the device parameters will stay as configured, the host parameters will reset to default.

Parameter configuration can be done via the HIM or Connected Components Workbench (CCW) V10 or higher.

Configure the Device Parameters first. When configuring the device, it is very important Device **Parameter 13 [Config Control]** be set to "Unlock". Once this parameter is configured to "Unlock" set up Device **Parameters 5-12 [Channel X Config Word]** (where X is a number 1-7) per the table below

Bit Names:		Ignored	Ignored	Wire 1	Wire 0	Temp Units	OC 1	OC 0	Range 4	Range 3	Range 2	Range 1	Range 0	Filter 2	Filter 1	Filter 0	Disable
Name	Setting	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Disable	Enable (Default)																0
	Disabled																1
Filter	17 Hz (Default)													0	0	0	
	4 Hz													0	0	1	
	60 Hz													0	1	0	
	240 Hz													0	1	1	
	470 Hz													1	0	0	
Range	4-20 mA (Default)								0	0	0	0	0				
	0-20 mA								0	0	0	0	0	1			
	0-5 V								0	0	0	0	1	0			
	0-10 V								0	0	0	0	1	1			
	0 to 20 ohm								0	0	0	1	0	0			
	0 to 150 ohm								0	0	1	0	0	1			
	0 to 500 ohm								0	0	1	1	0				
	0 to 1000 ohm								0	0	1	1	1				
	0 to 3000 ohm								0	1	0	0	0	0			
	10 ohm Copper 426								0	1	0	0	0	1			
	100 ohm Platinum 385								0	1	0	1	0				
	200 ohm Platinum 385								0	1	0	1	1				
	500 ohm Platinum 385								0	1	1	0	0	0			
	1000 ohm Platinum 385								0	1	1	0	1				
	100 ohm Platinum 3916								0	1	1	1	0				
	200 ohm Platinum 3916								0	1	1	1	1				
	500 ohm Platinum 3916								1	0	0	0	0				
	1000 ohm Platinum 3916								1	0	0	0	0	1			
	120 ohm Nickel 672								1	0	0	0	1	0			
	100 ohm Nickel 618								1	0	0	0	1	1			
604 ohm Nickel-Iron 518								1	0	1	0	0					
OC Action	Full Scale (Default)								0	0							
	Minimum Scale								0	1							
	Zero								1	0							
Temp. Units	Deg C (Default)					0											
	Deg F					1											
Wire Mode	3-Wire (Default)			0	0												
	4-Wire			0	1												
	2-Wire			1	0												
Ignored	N/A	X	X														

It is recommended to optimize performance that unused channels be set to disable (set bit '0' to a '1').

Next configure the Host **Parameters 1-10 [DL From Net X]** (where X is a number 1-10).

## Datalink Configuration

Each DL is a datalink. DL1 is Channel 0, DL2 is Channel 1 and so on. The term "From Net" is sometimes misunderstood. The "From Net" parameters are actually mapping from the card to wherever you point to. Configure the 'HOST' parameters 'DL From Net' as the table below. Set the datalink parameters in the Spectrum card to the PF750 or PF755T setting based on your drive.

Commonly, Host **Parameter 1 [DL From Net 1]** is set to "Port 0 Parameter 1800", **Parameter 2 [DL From Net 2]** is set to "Port 0 Parameter 1801", and so on. Use Parameters 800, 801.... for PF755T drive. With this said though, these datalinks could be configured to point to any writable parameter that is a "Real Type" data type.

***DL 9 and DL 10 are special datalinks that are used to map the input status of the card and module status respectively, These Datalinks are intended as DINT data types. These parameters are configured as below:***

**Parameter 9 [DL From Net 9] =** Port 0 (Parameter 1700 for PF755/753) or (Parameter 700 for PF755T)

**Parameter 10 [DL From Net 10] =** Port 0 (Parameter 1701 for PF755/753) or (Parameter 701 for PF755T)

Function	20-750sc-8u DL From Net	PF750 Setting	PF755T Setting	Port 0 Parameter Name
Ch 0 Data	Port x Parameter 01 [DL From Net 01]	Port 0 Parameter 1800	Port 0 Parameter 800	UserData Real 00
Ch 1 Data	Port x Parameter 02 [DL From Net 02]	Port 0 Parameter 1801	Port 0 Parameter 801	UserData Real 01
Ch 2 Data	Port x Parameter 03 [DL From Net 03]	Port 0 Parameter 1802	Port 0 Parameter 802	UserData Real 02
Ch 3 Data	Port x Parameter 04 [DL From Net 04]	Port 0 Parameter 1803	Port 0 Parameter 803	UserData Real 03
Ch 4 Data	Port x Parameter 05 [DL From Net 05]	Port 0 Parameter 1804	Port 0 Parameter 804	UserData Real 04

Ch 5 Data	Port x Parameter 06 [DL From Net 06]	Port 0 Parameter 1805	Port 0 Parameter 805	UserData Real 05
Ch 6 Data	Port x Parameter 07 [DL From Net 07]	Port 0 Parameter 1806	Port 0 Parameter 806	UserData Real 06
Ch 7 Data	Port x Parameter 08 [DL From Net 08]	Port 0 Parameter 1807	Port 0 Parameter 807	UserData Real 07
Input Status	Port x Parameter 09 [DL From Net 09]	Port 0 Parameter 1700	Port 0 Parameter 700	UserData Int 00
Mod Status	Port x Parameter 10 [DL From Net 10]	Port 0 Parameter 1701	Port 0 Parameter 701	UserData Int 01

The module status bit configuration is given below:

Values	Unused															
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit[31:16]	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Values	Unused	Firmware	Cal Fault	Watchdog	Comms Fault	ADC Fault										
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit[15:00]	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

- Bit-0:** ADC Fault. Bit set when an error is detected by the analog processor while communicating with the ADC.
- Bit-1:** Comms Fault. Bit set when communications to the analog processor is disrupted.
- Bit-2:** Watchdog TO. Watchdog timer has timed out. A critical software error has taken place.
- Bit-3:** Cal Fault. Calibration data is invalid and the option card is running with uncalibrated measurements. Calibration must be performed at the factory.
- Bit-4:** Firmware Fault. Firmware mismatch between main CPU and Analog CPU.

Once the card is configured set Device **Parameter 13 [Config Control]** be set to "Lock" for data from the wired inputs to update parameters in the drive.

Doing a drives factory reset power down the drive REMOVE the 20-750sc-8U card then on power up do the fix with the card removed and do the reset to defaults.

**NOTE:** For setup help with a **20-750-IF4XOF4-SC**, please reference [QA47228 - PowerFlex 750 Series: 20-750-IF4XOF4-SC Setup](https://www.spectrumcontrols.com/PowerFlex-750-Series-20-750-IF4XOF4-SC-Setup).
